

Why are LC LiDAR fiber optic interfaces so widely used

Overview

LC (Lucent Connector or Little Connector) fiber optic connectors have become the dominant interface in modern data centers due to their compact size, reliable optical performance, and compatibility with high-density network architectures. It operates on the principle of emitting laser pulses and measuring the time it takes for the light to bounce back after hitting. The LC connector, short for Lucent Connector, was developed by Lucent Technologies (now part of Nokia) in the 1990s as a next-generation alternative to older SC and ST connectors. It features a small form factor design with a 1. They are about half the size of standard SC connectors, making them an excellent choice for applications where space is tight. In its simplest form, it's a technology that enables the detection of objects at a distance using light and that can be understood as being a radar that uses laser light instead of radio waves. The most used LIDAR technique is what is called.
